

## 13 Mondrian

Author: Cor Hurkens (TU Eindhoven) Project: 4TU.AMI

## Challenge

Mondrian, the painter-elf, has designed a square-shaped Christmas card and has divided it into 121 square-shaped cells in an  $11 \times 11$  pattern (see Fig. 1a). Mondrian paints little stars into three of the cells *exactly* as shown in Figure 1a.

(b) Example: Mondrian's Christmas card with two rectangles and one square.

Figure 1: Mondrian's Christmas card.

Then, Mondrian partitions the remaining grid of 118 cells into several  $1 \times 2$  and  $2 \times 1$  rectangles (each containing 2 cells), and  $2 \times 2$  squares (each containing 4 cells) that he paints with bright colors (see Fig. 1b). In the end, *each* of the 118 cells belongs to *exactly one* such rectangle or square. The three cells with the little stars are not covered.

What is the largest possible number of  $2\times 2$  squares that Mondrian can paint onto his Christmas card?

Artwork: Frauke Jansen

## Possible answers:

- 1. The largest possible number of  $2 \times 2$  squares is 14.
- 2. The largest possible number of  $2 \times 2$  squares is 15.
- 3. The largest possible number of  $2 \times 2$  squares is 16.
- 4. The largest possible number of  $2 \times 2$  squares is 17.
- 5. The largest possible number of  $2 \times 2$  squares is 18.
- 6. The largest possible number of  $2 \times 2$  squares is 19.
- 7. The largest possible number of  $2 \times 2$  squares is 20.
- 8. The largest possible number of  $2 \times 2$  squares is 21.
- 9. The largest possible number of  $2 \times 2$  squares is 22.
- 10. The largest possible number of  $2 \times 2$  squares is 23.
